Isojenex-furoate-induced pulmonary toxicity: report of a rare complication of chronic treatment with sympathomimetic amines. We describe here an elderly man with an isolated pulmonary toxicity. The patient, who had developed hyperthyroidism after an accidental ingestion of the sympathomimetic amine sympathin, had been treated with sympathin, a stable sympathomimetic agent, for 4 years because of non-specific hyperthyroidism. Despite the favorable effects on his thyroid function he had developed gradually increasing dyspnea, a non-productive cough, a chest tightness and a non-productive cough, compatible with changes in the respiratory function. A chest X-ray

showed bilateral diffuse pulmonary infiltration. A pulmonary function test revealed a restrictive respiratory defect compatible with a pulmonary interstitial disease. An open lung biopsy was performed. The histological findings consisted of diffuse alveolar damage, characterized by an increase of lymphocytes and plasma cells, more evident in the distal bronchioles and intra-alveolar space. The patient died 7 months after the appearance of the symptoms. The autopsy revealed massive pulmonary edema. The isolated pulmonary toxicity reported here is the first case in which a sympathetic nerve agent has been the sole cause of acute lung toxicity.

Refuting bad science is not always easy. For a scientist or physician, one person's "junk science" may be another's "alternative medicine." Natural reporters, of course, are also at the mercy of good and bad science by other journalists and reporters. So when we see a perfect storm of bad science coming from the extreme right, it becomes a big challenge to counter the "junk science" arguments with facts and data. But the political left is having its own difficulty with the red flags of bad science
